

Laser Metal Marking

Metal Marker G

The Metal Marker G is a metal black laser marking product for CO₂ laser engravers. It allows a black marking on aluminum, brass, mild or stainless steel, magnesium and copper.

Metal Marker G is sold in a 46ml (1.56oz) applicator bottle, which represents 0.9m² of coverage. This represents more than 30% more surface area covered compared to products using a spray system.

Thanks to its sealed applicator bottle, the black laser marking can be stored for up to a year even after the first use.

Unlike aerosol products, it is not necessary to wear a protective mask. The liquid form of the Metal Marker G ensures a non-volatile application reducing the need for PPE to the simple wearing of gloves.

TherMark® laser marking tape, spray & pastes

Tape for efficient dry permanent marking and water-based spray & pastes for fast clean up

TherMark® tape is an ideal product for expanding the range of materials that can be marked with a CO₂ laser engraver. Available in a 50ft roll in 3 standard widths (1", 2" & 3" wide), it can be used to create high contrast, permanent black marks on bare, plated and anodized metals. Cut the tape to the size of the mark, then simply apply by hand and engrave with a 30W and above laser. The excess tape is then peeled off to reveal the final mark. This product is suitable for outdoor use.

TherMark® liquid pastes allow most metals to be quickly marked using a CO₂ laser engraver. A thin coat of material can be painted or sprayed onto the metal, then left to dry for less than 2 minutes. Engrave with your laser of 25W or greater to produce high contrast, permanent black marks. The excess water-based materials can be easily washed off to reveal the final mark.

CerMark® laser marking spray & pastes

Solvent-based for easy handling before marking

CerMark® metal marking pastes also allow most metals to be marked using a CO₂ laser engraver. Similar to TherMark liquids, the CerMark products contain a hardener that allows the products to be easily handled prior to marking with your laser. The final result is the same permanent black marks on a range of bare metals. Good for CO₂ lasers, 25W and above.
